

# INDEX

Note: Page numbers followed by “f” indicate figures, and “t” indicate tables.

## A

Advanced Euler–Lagrange models, 217  
Approximate deconvolution models  
(ADM), 214

## B

Beetstra–Van der Hoef–Kuipers (BVK) drag  
model, 61–63, 98–99  
Benchmarking particle-resolved direct  
numerical simulation, 192–198  
Bubbling fluidized bed  
computational fluid dynamics–time-  
driven hard sphere model, 89–94  
heat transfer, 98f  
parameters in, 91t  
simulation setting, 90f  
Buoyancy forces, 177

## C

Carbon mass fraction, 112–113  
fluid catalytic cracking regenerator,  
121–123, 122f  
CFD. *See* Computational fluid dynamics  
(CFD)  
CGHS method. *See* Coarse-grained hard  
sphere (CGHS) method  
CGP. *See* Coarse-grained parcel (CGP)  
Chemical reactions  
computational fluid dynamics–discrete  
element method, 68–69  
fluid catalytic cracking regenerator,  
113–117  
methane-to-olefin reactor, 128–129  
rare earth elements leaching reactor,  
133–136  
Circulating fluidized bed (CFB), 56, 109  
computational fluid dynamics–coarse-  
grained hard sphere method,  
102–109, 103f, 147f  
parameters, 104t  
simulation results, 74–75, 95  
Closure laws, 23

at macrolevel, 179–183  
at mesolevel, 174–179  
two-fluid model, 32–35, 33–34t  
Cluster-induced turbulence (CIT), 179–180  
Coarse-grained computational fluid  
dynamics–discrete element method  
(CFD–DEM), 69–70,  
72–75, 77f  
assumptions, 70–72, 71f  
gas–particle flows, 19, 27–29, 28–30f  
heat transfer, 75–80, 77f, 98–102, 99t  
time-driven hard-sphere contact model,  
80–84  
verification study, 94–97, 95–97f  
Coarse-grained governing equations,  
224–228  
mass balance, 223–224  
microscopic equations, 223  
momentum equations, 224–226  
scalar transport equations, 226–227  
transport equations, 227–228  
volume averaging, 223  
Coarse-grained hard sphere (CGHS)  
method, 109–110  
computational fluid dynamics, 102–109,  
103f  
fluidized catalytic cracking regenerator,  
110–125, 111f, 119–120f,  
122f, 124f  
methane-to-olefin reactor, 125–133  
rare earth elements leaching reactor,  
133–143, 136f, 138–139f,  
141–143f  
Coarse-grained mass balance, 223–224  
Coarse-grained parcel (CGP), 70–72  
contact radius, 79  
particle–fluid–wall heat transfer, 75–78  
size and collision parameters, 72–74  
Coarsening, 210–212  
Cohesive forces, 212–214  
Coke mass fraction, 130–131, 131–132f  
Collision force, 65, 72–74

Computational fluid dynamics  
   (CFD), 54–56, 58–59  
   CFD–coarse-grained hard sphere  
     method, 102–109, 103f  
 Computational fluid dynamics–discrete  
   element method (CFD–DEM), 60  
   chemical reactions, 68–69  
   coarse-grained, 69–80, 71f, 77f, 83f  
   fluid dynamics, 61  
   heat transfer model, 66–68, 67f, 99t  
   heights simulated with, 96f  
   instantaneous particles distribution,  
     92f, 95f  
   momentum transfer models, 61–64  
   solid particle dynamics, 64–65  
 Computational fluid dynamics–time-driven  
   hard sphere (CFD–TDHS) model  
   bubbling fluidized bed, 89–94  
   granular temperature profiles, 94f  
   heights simulated with, 96f  
   instantaneous particles distribution,  
     92f, 95f  
   verification study, 94–97  
 Conservation equations  
   for continuous phase, 21–22  
   for dense fluid–solid flows, 22  
   flow of continuum powder, 55–56  
   fluid phase, 9–10  
   heat transfer, 66  
   thermal energy, 68  
   two-fluid models, 39  
 Contact force, 55–56, 64–65  
 Continuity equation, 7, 25, 35–37  
 Continuous forcing methods (CFM), 9  
 Continuous phase governing equations  
   particle-resolved approach, 168–169  
   particle-unresolved approach, 169  
 Conventional finite volume techniques, 184  
 Convergent approach, 189, 190f  
 Counter-current fluidized bed  
   under different operating conditions,  
     136–139  
   geometries at different scales, 140t  
   parameters, 138t  
 CPPPO model, 160, 186–189, 188f  
   Lagrangian *vs.* Eulerian filtering tools,  
     193f  
 Cross effects, 199

## D

Damping coefficient, 64–65, 74  
 Deconvolution approach, 214–215  
 Defiltering method, 214  
 DEM. *See* Discrete element model (DEM)  
 Dense fluid–particle systems  
   advanced Euler–Lagrange models, 217  
   broader application, 217–219  
   chemistry and material models, 156–157  
   closure laws  
     at macrolevel, 179–183  
     at mesolevel, 174–179  
   coarse-grained equations, 224–228  
   coarse-grained mass balance, 223–224  
   connection of models  
     computational strategies, 160–163  
     data science, 164  
   dispersion coefficients, 179  
   filtering tools, 185–191  
   flow models, 157–159

## G

Gas-fluidized bed

granulator, 5, 5*f*

with heat production

discrete element model, 27–28, 28–29*f*  
two-fluid model, 44–48, 47*t*, 48*f*

pseudo 2D

direct numerical simulation, 18–20, 18*t*, 20*f*

discrete element model, 28–29, 30–31*f*  
two-fluid model, 37–39, 38*f*, 38*t*, 40*f*

Gas mixture properties, 112*t*

Gas-particle flows, 4–8

direct numerical simulation, 8–9, 8*f*

flow and heat transfer, 13–18, 13*t*, 15*f*, 16*t*, 17*f*

fluid phase equations, 9–10

governing equations, 9–10

numerical solution method, 11–13

particle equations, 10

pseudo 2D fluidized bed of spheres, 18–20, 18*t*, 20*f*

discrete element model, 8*f*, 21–22

fluid phase equations, 22–23

gas-fluidized beds with heat production, 27–28, 28–29*f*

governing equations, 22–24

hydrodynamics of pseudo 2D riser, 28–29, 30–31*f*

numerical solution method, 24–26

particle phase equations, 23–24

multiscale approach, 8, 8*f*

suspension flows, 156–157

two-fluid model, 8*f*, 30–32

bubble size distributions, 45*f*

closure equations, 33–34*t*

gas-fluidized bed with heat production, 44–48, 47*t*, 48*f*

governing equations, 32–35, 32*t*

numerical solution method, 35–37

pseudo 2D gas-fluidized bed, 37–39, 38*f*, 38*t*, 40*f*

3D cylindrical bed, 39–44, 41*t*, 42*f*

Gas-particle system, 228–229

Gas phase stresses, 181

Geldart D particles, 42–43, 90–91

Gidaspow drag model, 61–63, 102–103

Governing equations

continuous phase

particle-resolved approach, 168–169

particle-unresolved approach, 169

scalar transport, 172–173

direct numerical simulation, 9–10

- Particle-resolved (PR)–EL models, 166–167, 166*f*
- Particle resolved simulation (PRS), 8–9
- Particles fluctuating energy, 93–94
- Particle size distribution (PSD), 117–121, 145–147
- Particles settling system, 85, 85*f*, 86*t*
- Particle-unresolved (PU)–EL models, 167–168, 167*f*
- Particle velocity, 103–105, 121–123
  - collision process, 81–82, 83*f*
  - measurements, 58–59
  - suspension process, 81

Particle-wall contact conduction, 66–68,  
100–102, 101*f*  
 Particle-wall distance, 76–78  
 Particulate phase, stress in, 181–182  
 PIV. *See* Particle image velocimetry (PIV)  
 Positron emission particle tracking (PEPT)  
   technique, 42–43, 43*f*  
 PR-direct numerical simulation (PR-DNS),  
   168–169  
 Probe technique, 43–44  
 Pseudo 2D gas-fluidized bed  
   direct numerical simulation, 18–20, 18*t*,  
     20*f*  
   discrete element model, 28–29, 30–31*f*  
   two-fluid model, 37–39, 38*t*, 38*f*, 40*f*

## R

Rand corporation study, 54  
 Rare earth elements (REE) leaching reactor,  
   109–110, 133–143, 136*f*, 138–139*f*,  
   141–143*f*  
 Reaction constant, methane-to-olefin, 129*t*  
 Restitution coefficient, 74–75, 79, 84,  
   105–107  
 Richardson–Zaki type velocity–voidage  
   correlation, 61–62  
 Rotational motion, 171–172

## S

Scalar transport models  
   dispersion coefficients, 179  
   heat transfer, 178–179  
   mass transfer, 178–179  
 Scale bridging, 154–156  
 Scaling law, 74, 84  
 Sequential fluid coarsening, 210–212  
 SIMPLE algorithm, 21–22, 30–31, 36  
 Solid particle dynamics, 64–65  
 Stokes drag law, 202  
 Stokesian dynamics (SD), 183–184  
 Superficial gas velocity, 47–48, 48*f*  
 Suspension process, 80–81  
 Syamlal–O’Brien drag model, 61–63, 89–90

## T

Tangential contact force, 65  
 TFM. *See* Two-fluid model (TFM)  
 3D cylindrical bed, 39–44, 41*t*, 42*f*

Time-driven hard-sphere (TDHS)  
   model, 59–60  
   coarse-grained computational fluid  
     dynamics–discrete element method,  
     80–84  
   computational fluid dynamics  
     bubbling fluidized bed, 89–94  
     granular temperature profiles, 94*f*  
     heights simulated with, 96*f*  
     instantaneous particles distribution, 92*f*,  
     95*f*  
     verification study, 94–97  
   dense granular flow, 85–89  
 Translational motion, 170–171  
 Two-fluid model (TFM), 7, 8*f*, 30–32, 155  
   bubble size distributions, 45*f*  
   closure equations, 33–34*t*  
   gas-fluidized bed with heat production,  
     44–48, 47*t*, 48*f*  
   governing equations, 32–35, 32*t*  
   numerical solution method, 35–37  
   pseudo 2D gas-fluidized bed, 37–39, 38*t*,  
     38*f*, 40*f*  
   3D cylindrical bed, 39–44, 41*t*, 42*f*  
 Two-fluid models (TFM), 72–73, 102–103

## U

Uncertainties  
   evaluation, 58–59  
   fluidized beds, 72–73, 108–109  
   model-induced, 96–97

## V

Volume-averaged governing equations  
   gas-particle system, 228–229  
   low mach number, 228  
   no-slip condition, 228  
   not-deformable particles, 228  
   simplified equations, 229  
 Volume-averaged Navier–Stokes equations,  
   7, 21, 61, 70

## W

Wall effects, 203–209  
 Wall radial distribution function, 206  
 Wen–Yu drag model, 61–63, 136–138

## X

X-ray tomography, 44, 45*f*
